Installing VXT Software on a Hewlett–Packard HP–UX System

This chapter provides instructions for installing VXT software on computers that are running the HP–UX operating system. Read the chapter before starting the installation procedure.

1.1 Preparing for the Installation

This section discusses the preparations and requirements for installing the VXT software on an HP–UX system.

Your bill of materials (BOM) specifies the number and contents of your media. Be sure to verify the contents of your kit with this information. If you find missing or damaged parts in your kit, contact your local Digital representative.

Checking the Media Software Distribution Kit

For installations from media, use the BOM to check the contents of your software distribution kit.

The kit includes this installation guide and one of the following:

- A 9-track magnetic tape (MT9), labeled VXT Software V2.1, for systems with magnetic tape drives

- A digital data storage (DDS) tape, labeled VXT Software V2.1, for systems with DDS drives

Using the Release Notes

The software kit provides release notes. The documentation kit also provides a hardcopy of the release notes. Digital strongly recommends that you read the release notes before proceeding with the installation.

Operating Environment

VXT Version 2.1 software requires HP–UX Version 8.05 or later software.

1.2 Installation Procedure Requirements

This section includes VXT software installation requirements.

Installation Time
The installation takes 20 to 30 minutes, depending on the type of media and your system configuration. Loading fonts generally requires more time for installation than other subsets.

Privileges Needed for Installation
You must log in as a superuser on the system where you are installing the software.

1.2.1 Prerequisite Hardware

To perform the installation, you need the following hardware:

- Software distribution device (if installing from media)

  You need a distribution device that corresponds with the software distribution media. For example, if you have a DDS software kit, you need a DDS tape drive. You must know how to load the media supplied with the software distribution kit on the appropriate drive. The documentation for the tape drive that you are using explains how to load the media.

- Terminal or console workstation

  You can use a video terminal, hardcopy terminal, or terminal emulator running on a workstation to communicate with the operating system and respond to prompts from the installation procedure for the software.

1.2.2 Prerequisite Software

Table 1–1 describes the prerequisite software you can use with the VXT software.

Table 1–1 Prerequisite Software—HP–UX Systems

Prerequisite Products	Purpose
HP–UX Version 8.05	Provides base system and installation support.
C compiler, program development header files, X or DECwindows header files	Required if you install the VXT BOOTP daemon, printer support utilities, application launcher, and X font utilities.

Your system must be running HP–UX Version 8.05 or later before you try to install VXT Version 2.1 software, or the installation will fail. See your system documentation for instructions on how to install HP–UX Version 8.05 software.

1.2.3 Determining Which Subsets to Load

Use Table 1–2 to choose the software subsets you want to load.

Table 1–2   VXT Software Subsets—HP–UX Systems

Subset	Description	Recommendation
System images	The load images for supporting network booting by host terminals.	Install on a system designated to provide network booting support (BOOTP) for host terminals.
BOOTP daemon	A BOOTP daemon to provide network service using BOOTP/TFTP.	Do not install. Use your host system's BOOTP daemon to provide network booting (BOOTP) support for host terminals.
		If your host system does not have a BOOTP daemon, you can use this daemon.
Application launcher	A mechanism that lets terminal users display remote X applications. The launcher supports an `rexec` function used with the `f.exec` function in the local window manager.	Install on any system that needs to support remote X applications.
Printer support utilities	Utilities that support printing from a host to the terminal's attached printer, using the TCP /IP network transport for communication.	Install on any system that wants to use the TCP/IP transport to send printing jobs to a terminal's attached printer.
X font utilities	A BDF-to-PCF font compiler and supporting tools to compile custom fonts and man pages for these utilities. The `xbdfdump` utility retrieves BDF files from any X server.	Install on any system that needs to compile BDF fonts for use by the terminal. (You must have X developers' .h files.) See Chapter 2 for information on using these utilities.
Compiled fonts	Compiled DECwindows and MIT fonts (merged set of all unique fonts). The subset allows you to select 75 dots/in., 100 dots/in., and miscellaneous fonts.	Install on a system designated to provide compiled fonts for terminals and systems that do not already have these fonts.

Notes on Installing Fonts

- If your system already has some or all of the compiled fonts, make sure they are the correct resolution required by the terminal. If not, you need to install the font subsets. Even if you have the compiled fonts, you may want to install the X font utilities supplied in the VXT kit, which make compiling and installing fonts easier.

- If you are installing the compiled fonts provided, they must be installed into a new or empty directory. If you are upgrading from an earlier VXT software version, use the `rm-vxt-kit` script supplied with the earlier version to remove the previous installation files.

1.2.4 Determining Which Images to Install

Use Table 1–3 to select the VXT system images you want to install.

Table 1–3 VXT System Images

File	Description	Features, Uses, and Memory Requirements
vxt	VXT software	**Features:** • All VXT software features • VXT local clients • X image extension (XIE) **Uses:** • All VXT 2000 windowing terminals (color, gray scale, and monochrome) **Terminal memory requirements (minimum):** • 10 MB
vxtex	VXT EX software	**Features:** • Clientless version of VXT software • Simple user interface for making X connections to hosts **Uses:** • All VXT 2000 windowing terminals (color, gray scale, and monochrome) **Terminal memory requirements:** • 4 MB
vxtldr	VXT loader	**Features:** • Loads server-based terminals from an InfoServer system. • Installed as one file, but available under two names (vxtldr and vxtldr1). **Uses:** Not needed, unless you are loading terminals from an InfoServer system on a different Ethernet segment. In this case, install the VXT loader on a host in the same segment as the terminals.

1.2.5 Determining Disk Space Requirements

This section describes the disk space requirements for the disks that you load the software subsets on.

Table 1–4 lists the disk space requirements for loading the software subsets on HP–UX software for HP-UX computer systems. This table specifies disk space requirements by subset.

Table 1–4 Worksheet for Subset Sizes on HP–UX Systems

Subset Name	Transient Size (K bytes/Blocks)	Installed Size (K bytes/Blocks)
VXT software images		
VXT software	6,200/12,400	5,100/10,200
VXT EX software	2,400/ 4,800	1,200/ 2,400
VXT loader	800/ 1,600	400/ 800
Application launcher	700/ 1,400	350/ 700
VXT printer support utilities	400/ 800	200/ 400
X font utilities	1,200/ 2,400	600/ 1,200
Compiled fonts		
75 dots/in	10,120/20,240	5,060/10,120
100 dots/in	19,000/38,000	9,500/19,000
Miscellaneous	12,000/24,000	6,000/12,000
Individual totals:	~52,720/~105,440	~28,060/~56,120

Transient Space

The transient space must be available in the file system containing the installation's working directory. The installed space must be available where the product will reside. These locations may be distributed across multiple file systems.

Add Up Subsets

Using Table 1–4, add up the total values for the subsets you plan to load in each file system. Use this sum to determine the disk space requirement for your installation.

Compare the space required for the subsets with the free space currently in the file systems where the software files will reside.

Determine Free Space

To determine the current amount of free space for a directory path, log in to the system where you plan to install the software and enter the df command. For example:

```
%  bdf   Return

% Filesystem    kbytes    used    avail    capacity  Mounted on
      /dev/dsk/0s0  313742   140832  141835      50%    /
      foo:/x11r4    271847   171159   73504      70%    /foo
```

A file system must have enough free space to meet the Table 1–4 space requirements.

If you have insufficient disk space, you can perform an NFS mount from a server that has sufficient space. For example:

```
%  su
#  mount –t nfs server:/usr/free_disk /usr/tftpboot
```

Table 1–5 shows the default locations for each subset.

Table 1–5   Default Locations of Individual Subsets—HP–UX Systems

Subset Name	Default Location
VXT software images	`/usr/tftpboot/vxt/images`
VXT application launcher	Images and scripts in `/usr/local/bin` Man pages in `/usr/local/man/man1`
VXT printer support utilities	Images and scripts `/usr/local/bin` Documents in `/usr/tftpboot/vxt` Man pages in `/usr/local/man/man1`
X font utilities	Images and scripts in `/usr/local/bin` Man pages in `/usr/local/man/man1`

Compiled fonts	`/usr/tftpboot/vxt/fonts/75dpi`
	`/usr/tftpboot/vxt/fonts/100dpi`
	`/usr/tftpboot/vxt/fonts/misc`

1.2.6 Backing Up Your System Disk

Digital recommends that you back up your system disk before installing any software. Use the backup procedures established at your site.

1.3 Starting the Installation

This section provides step-by-step instructions for installing VXT software on an HP–UX system.

The installation procedure consists of a series of questions requiring user responses, as well as informational messages. See Section 1.5 for an example of an actual installation.

To end the installation procedure at any time, press Ctrl C. When you press Ctrl C, the installation procedure saves the files it has already installed, deletes working directories, and exits the process.

Appendix B lists the possible files and directories created during the installation. After your complete the installation, you can check the `install.flist` file for the list of files actually installed.

There are three ways to start the VXT software installation:

- From a DDS or 9-track magnetic tape on a local drive
- From a `tar` file on a local disk drive
- From a `tar` file on a remote disk drive, using TCP/IP

The following sections describe each method. In each case, the installation procedure loads the software files onto a disk that belongs to the system you are performing the installation for.

1.3.1 Installing from a Local DDS or Magnetic Tape Distribution Media

To start the installation:

1. Mount the media on the appropriate tape drive. Use a nonrewinding tape device for the installation. For example: /dev/*rmt/0mn*.

2. Log in as a superuser (login name root) on the system that you are installing the software on.

3. Choose a convenient empty work directory from which to do the installation. Use the cd command to move to that directory. If you do not have an empty work directory, you may choose to create a new directory. Make sure there is sufficient transient work space.

   For example:

   ```
   #  mkdir /usr/vxt      #this may already exist
   #  mkdir /usr/vxt/kit  #this may already exist
   #  cd /usr/vxt/kit
   ```

4. Use the tar command to access the kit media in a local tape drive:

   ```
   #  tar -xf /dev/rmt/0mn
   ```

   /*dev*/*rmt*/*0mn* is the device name of the source drive that holds the distribution tape. The device name may be different on your system.

5. Execute the shell script with the Bourne shell command sh, specifying how to access the installation kit:

   ```
   #   sh install.sh /dev/rmt/0mn
   ```

To continue the installation, go to Section 1.4.

1.3.2 Installing from Local tar Files

VXT Version 2.1 software uses two tar files. Previous versions used one file. You may need to extract the two tar files from the media to files, to allow electronic access by another system.

1. Log in as a superuser (login name root) on the system that you are installing the software on.

2. Choose a convenient empty work directory from which to do the installation. Use the cd command to move to that directory. If you do not have an empty work directory, you may choose to create a new directory. Make sure there is sufficient transient work space.

   For example:

   ```
   #  mkdir /usr/vxt      #this may already exist
   #  mkdir /usr/vxt/kit  #this may already exist
   #  cd /usr/vxt/kit
   ```

3. Use the following two dd commands to extract the two tar files. In this example, the media device is rmt/0mn:

   ```
   #  dd if=/dev/rmt/0mn of=/usr/vxt/VXT-2.1.tar1 ibs=10k
   #  dd if=/dev/rmt/0mn of=/usr/vxt/VXT-2.1.tar2 ibs=10k
   ```

VXT-2.1.tar1 is the first extracted file and contains the installation scripts.

VXT-2.1.tar2 is the second extracted file and contains the files to be installed.

You can specify different file names if desired.

To start the installation:

4. Use the `tar` command to access the first local `tar` file, which containts the installation script:

   ```
   # tar -xf /usr/vxt/VXT-2.1.tar1
   ```

5. Execute the shell script with the Bourne shell command `sh`, specifying how to access the installation kit in the second `tar` file:

   ```
   sh install.sh VXT-2.1.tar2
   ```

To continue the installation, go to Section 1.4.

1.3.3 Installing from Remote tar Files, Using TCP/IP

VXT Version 2.1 software uses two `tar` files. You may need to extract the two `tar` files from the media to files, to allow electronic access by another system.

Use the following two `dd` commands to extract the two `tar` files. In this example, the media device is `/rmt/0mn`:

```
# dd if=/dev/rmt/0mn of=/usr/vxt/VXT-2.1.tar1 ibs=10k
# dd if=/dev/rmt/0mn of=/usr/vxt/VXT-2.1.tar2 ibs=10k
```

VXT-2.1.tar1 is the first extracted file and contains the installation scripts.

VXT-2.1.tar2 is the second extracted file and contains the files to be installed.

You can specify different file names if desired.

To start the installation:

1. Log in as a superuser (login name root) on the system that you are installing the software on.

2. Choose a convenient empty work directory from which to do the installation. Use the `cd` command to move to that directory. If you do not have an empty work directory, you may choose to create a new directory. Make sure there is sufficient transient work space.

   For example:

   ```
   # mkdir /usr/vxt/kit
   # cd /usr/vxt/kit
   ```

3. Use the `remsh` command to access the first remote `tar` file, which contains the installation script:

   ```
   # remsh ip_nodename cat /usr/vxt/VXT-2.1.tar1 | tar -xf -
   ```

   ip_nodename is the IP name of the remote node where the tar file is retrieved.

To use the `remsh` command, you need appropriate access to the remote machine.

4. Execute the shell script with the Bourne shell command `sh`, specifying how to access the installation kit in the second `tar` file:

   sh install.sh remsh *ip_nodename* cat */usr/vxt/VXT–2.1.tar2*

To continue the installation, go to Section 1.4.

1.4 Responding to Script Prompts

After you enter the `sh install.sh` command for local or remote (node-specific) installations, the installation script begins. See the sample installation script (Section 1.5).

- Choose the HP–UX operating environment.
- Choose the subsets that you want to load.
- Respond to the questions for each selected subset.

At each point, you have the option to exit the installation.

After you answer all questions, the script performs the installation. You do not have to be present while the installation is in progress.

1.4.1 Error Recovery

If errors occur during the installation, the system displays failure messages. Errors can occur during the installation if any of the following conditions exist:

- Incorrect operating system version
- Incorrect version of prerequisite software
- Incorrect or missing .h or C compiler files for font utilities, `bootpd`, and printer utilities
- Insufficient superuser privileges for a successful installation
- Insufficient quotas for a successful installation
- Insufficient disk space
- Device used was a rewinding device
- Incorrect file accessed using `install.sh` (`VXT-2.1.tar1` script was accessed instead of `VXT2.1.tar2` kit.)

For descriptions of error messages generated by these conditions, see the HP–UX system documentation on system messages, recovery procedures, and HP–UX software installation. If you are notified that any of these conditions exist, you should take the appropriate action described in the message. For information on installation requirements, see Section 1.2.2.

See Appendix C for descriptions of subset error messages, user error messages, and other generic error messages.

1.4.2 Installation Procedure Is Complete

See Chapter 2 for startup requirements, procedures, and system management tasks.

After the installation, the following seven relevant files are in your working directory:

File	Description
install.flist	The list of all files installed on your system as part of the VXT software installation.
install.log	The installation log file.
rm-vxt-kit	A script that lets you remove VXT software from your system. This is useful for removing the files for *this version* when you upgrade VXT software. Move this script to a safe place for possible future use.
RelNotes.txt	*VXT Software Version 2.1 Release Notes* in text format.
vxtivp	Installation verification procedure
vxtpostinstall	Postinstallation checklist
isrd	Utility used by vxtivp

1.4.3 Determining and Reporting Problems

Software Errors

If you encounter a problem while using VXT software, report it to Digital. Depending on the nature of the problem and the type of support you have, you can take one of the following actions:

- Call Digital if your software contract or warranty agreement entitles you to telephone support.
- Submit a Software Performance Report (SPR).

Documentation Errors

If you find an error in the VXT documentation, fill out and submit the Reader's Comments form at the back of the document. Please include the section and page number where the error occurred.

You can also send your comments by electronic mail to the Internet address listed on the title page and Reader's Comments form.

1.5 Sample Installation Session for HP–UX Systems

This section contains a sample installation from a local file, including all options.

```
%  su  Return
Password:
#  cd /usr/vxt/kit  Return
#  tar −xf /usr/vxt/VXT−2.1.tar1  Return
#  sh install.sh  /usr/vxt/VXT−2.1.tar2    Return

(c) Digital Equipment Corporation  1992, 1993
DIGITAL VXT Software, version 2.1
```

```
This is the installation script for the
        DIGITAL VXT Software
        Version V2.1
installation kit. The kit contains several subsets.  You can choose which
subsets you want to install.  Each selected subset is
extracted into a temporary work area in the current working directory
before final installation.  Unless you request otherwise, all work
areas will be removed after the product is installed.

The installation occurs in two stages.  In the first stage, you answer questions
on images and subsets.  The second stage performs the actual installation
of the system images and subsets that you select. You do not need to be
present during the second stage.

This script refers you to sections of the VXT Software Version 2.1 Installation
and System Management manual for more information on some topics.

Please answer all questions.  Default answers are
displayed in square brackets ([]).  Press Return to choose the default answer.
For yes/no answers enter y or n.

Select your system environment or exit the installation.

        0.  Exit without completing installation
        1.  Digital ULTRIX
        2.  SunOS
        3.  Hewlett-Packard HP-UX
        4.  IBM AIX
        5.  SCO ODT
        6.  DEC OSF/1 AXP

Which environment are you using [3]? :  [Return]

environment is: HP-UX
is this correct [y]? :      [Return]

installing in the HP-UX environment

Select the subsets to install or exit the installation.

If you select subset 2, 3, 4, or the font compiler utilities
in 5, you need a C compiler and program development header files
on your host system.

If you specify more than one number, separate each number with a
space or a comma.

        0.  Exit without installing subsets
        1.  VXT Software Images
        2.  VXT BOOTP Daemon
        3.  VXT Host Application Launcher
        4.  VXT Printer Support Utilities
        5.  X Font Utilities (font compiler, etc.)
        6.  Compiled Fonts
        7.  Converting Sun Fonts for the VXT

You do not need to install the Compiled Fonts if you have already installed
them from a VXT Version 2.0 kit.

Which subsets do you want to install [1 3 4 5 6]? :  [Return]

selecting subsets: images app-launch vxtlpd font-utils fonts
is this correct [y]? :  [Return]

selected subsets: images app-launch vxtlpd font-utils fonts

Now you will answer questions for the subsets you have chosen.
```

```
This is the installation script for the
        VXT Software Load Images
installation kit.  You can select which VXT images to install, and
you have the option to specify where you would like the images installed.

See Table 1-3 in the Installing VXT Software on a HP-UX System chapter
for a description of the images.

Select the VXT images to install or exit the installation.

        0.   Exit without completing installation
        1.   VXT loader
        2.   VXT
        3.   VXT EX

Install the VXT loader on this system only if you want to support
terminals in server-based mode from an InfoServer on another Ethernet
segment.

Which images do you want to install [2 3]? :  Return

selecting subsets: VXT VXT_EX
is this correct [y]? :  Return

selected subsets: VXT VXT_EX

Where do you want to install the VXT Software Load images?
Enter the absolute pathname of the destination
directory or enter 'q' to quit this subset
[/usr/tftpboot/vxt/images]? :    Return

not a directory: /usr/tftpboot/vxt/images
do you want to create it [y]? :  Return

created: /usr/tftpboot/vxt/images

Where do you want to install the VXT Configuration File Template?
Enter the absolute pathname of the destination
directory or enter 'q' to quit this subset
[/usr/tftpboot/vxt/config]? :    Return

not a directory: /usr/tftpboot/vxt/config
do you want to create it [y]? :  Return

created: /usr/tftpboot/vxt/config

This is the installation script for the
        Application Launcher installation kit.  You can
specify where to install the Application Launcher image and man pages.
See the System Management Overview and System Management Tasks chapters
for more information on Application Launcher.

Where do you want to install the Application Launcher image?
Enter the absolute pathname of the destination
directory or enter 'q' to quit this subset
[/usr/local/bin]? :    Return

not a directory: /usr/local/bin
do you want to create it [y]? :  Return

created: /usr/local/bin

Where do you want to install the Application Launcher man pages?
Enter the absolute pathname of the destination
directory or enter 'q' to quit this subset
directory [/usr/local/man/man1]? :    Return
```

```
not a directory: /usr/local/man/man1
do you want to create it [y]? :  Return

created: /usr/local/man/man1

This is the installation script for the
        VXT Printer Support Utilities
installation kit. You can specify where to install the
VXT Printer Support Utilities images and man pages.

Where do you want to install the VXT Printer Support Utilities documents?
Enter the absolute pathname of the destination
directory or enter 'q' to quit this subset
[/usr/tftpboot/vxt]? :  Return

destination directory: /usr/tftpboot/vxt
is this correct [y]? :  Return

Where do you want to install the VXT Printer Support Utilities images?
Enter the absolute pathname of the destination
directory or enter 'q' to quit this subset
[/usr/local/bin]? :  Return

destination directory: /usr/local/bin
is this correct [y]? :  Return

Where do you want to install the VXT Printer Support Utilities man pages?
Enter the absolute pathname of the destination
directory or enter 'q' to quit this subset
[/usr/local/man/man1]? :  Return

destination directory: /usr/local/man/man1
is this correct [y]? :  Return

This is the installation script for the
        VXT Font Utilities
installation kit.  You can select which utilities to install.
The font compiler utilities include the font compiler and mkfontdir. These
are not needed for ULTRIX systems with DECwindows installed, but are needed
to compile fonts on other systems. The font installation utilities make
installing fonts easier on all systems.
You can specify where to install the utilities and man pages.

Select the subsets to install or exit the installation.

        0.   Exit without completing installation
        1.   Font compiler utilities
        2.   Font installation utilities

Which utilities do you want to install [1 2]? :  Return

selecting subsets: compiler_utilities install_utilities
is this correct [y]? :  Return

selected subsets: compiler_utilities install_utilities

Where do you want to install the VXT Font Utilities images?
Enter the absolute pathname of the destination
directory or enter 'q' to quit this subset
[/usr/local/bin]? :  Return

destination directory: /usr/local/bin
is this correct [y]? :  Return
```

Installing VXT Software on a Hewlett–Packard HP–UX System
1.5 Sample Installation Session for HP–UX Systems

```
Where do you want to install the VXT Font Utilities man pages?
Enter the absolute pathname of the destination
directory or enter 'q' to quit this subset
[/usr/local/man/man1]? :   Return

destination directory: /usr/local/man/man1
is this correct [y]? :   Return

This is the installation script for the
        Compiled Fonts
installation kit.  You can install 100dpi fonts, 75dpi
fonts, and miscellaneous fonts. You can specify where to install the
fonts.

Select font sets or exit the installation.

        0.   Exit without completing installation
        1.   100 dpi fonts
        2.   75 dpi fonts
        3.   Miscellaneous fonts

Which font sets do you want to install [1 2 3]? :   Return

selecting subsets: 100dpi_fonts 75dpi_fonts misc_fonts
is this correct [y]? :   Return

selected subsets: 100dpi_fonts 75dpi_fonts misc_fonts

Where do you want to install the Compiled Fonts?
Enter the absolute pathname of the destination
directory or enter 'q' to quit this subset
[/usr/tftpboot/vxt/fonts]? :   Return

destination directory: /usr/tftpboot/vxt/fonts
is this correct [y]? :   Return

created: /usr/tftpboot/vxt/fonts

What do you want to do with the temporary working directories?

        1.   Remove if successful; save if an error occurred (default)
        2.   Save working directories
        3.   Remove working directories

Which option do you want? [1]? :   Return

selecting save_on_error working directories
is this correct [y]? :   Return

You have the option of printing or displaying a postinstallation
checklist and running an Installation Verification Program to
ensure the installation completed successfully.

Should the postinstallation checklist be printed [n]? : y   Return

print postinstallation checklist; is that correct [y]? :   Return

What printer would you like the postinstallation checklist
to be printed on [default printer]? :   Return

Should the postinstallation checklist be displayed
on the terminal (using more) [n]? :   Return

do not display postinstallation checklist; is that correct [y]? :   Return
```

```
Do you want the Installation Verification Procedure (IVP)
to be run after installation [n]? :  Return

do not run the IVP; is that correct [y]? :  Return

If the installation encounters errors from the tar utility: See your HP-UX
system documentation for an explanation of the error and the appropriate
action to take.

If the installation process fails: Look in the install.log file in the working
directory to find information to help you diagnose the problem.

The installation will take approximately 5 minutes to 20 minutes if you do not
install compiled fonts, and from 10 minutes to 60 minutes if you do install the
compiled fonts.  The exact time depends on your system and installation media.

No more questions will be asked.  The installation is in progress.

HP–UX System Management Tasks

Chapter Overview

This chapter describes system management tasks for using VXT software with the HP–UX operating system.

The details for performing some procedures on your host system may differ slightly from the procedures described here. In that case, use the procedures in this chapter as a guideline and refer to your operating system documentation for specific instructions.

2.1 System Administration Checklist

The HP–UX operating system is a supported boot host for VXT 2000 windowing terminals. Before you use an HP–UX system as a boot host for these terminals, you must perform some minor reconfiguration steps on the host system.

Host and Terminals in the Same Subnet

To download VXT software successfully, the boot host and the VXT 2000 windowing terminal must be in the same subnet.

Checklist

Use the following checklist to ensure that you complete the system management tasks:

☐ **Booting and Downloading**

  ☐ **VXT system images**
  Install the VXT system images before starting with system management tasks (Chapter 1).

  ☐ **Directory structure**
  Configure the system so that the VXT system images and fonts are not on the root file system. You may use symbolic links to other file systems. See Section 2.3.

  ☐ **IP addresses**
  Contact your network administrator to obtain a unique Internet protocol (IP) address for each VXT 2000 windowing terminal that you plan to boot from your HP–UX system. Add these addresses to the /etc/hosts file on your system; if necessary, update the name server on your network.

  ☐ **Network services**
  Your host system must provide the boot protocol/trivial file transfer protocol (BOOTP/TFTP).

☐ **Boot setup**

- **Loading VXT software with IP (BOOTP/TFTP)**
  To download VXT software with an IP boot sequence, the host
  system needs a resident `bootp` daemon, configured correctly in the
  `/etc/inetd.conf` file. You also need a corresponding `bootptab`
  configuration file.

  Section 2.4 includes a sample `bootptab` file. Use the sample to set up a
  `bootptab` entry in the `/etc/bootptab` file.

  After you configure the system for IP (BOOTP/TFTP) booting, restart
  the Internet daemon to initialize the changes you made.

☐ **Fonts**   VXT software provides fonts in the portable compiled font (PCF) format. If
you need to use custom fonts, compile and install fonts in the PCF format. See
Sections 2.5 to 2.8.

☐ **NFS Access**   If you use the NFS transport to access fonts or resource files, those file systems
must be exported.

Optional System Management Tasks

☐ **X Services**   If you plan to use IP X sessions on terminals, make sure your host system
supports the X display manager control protocol (XDMCP). If needed, install
XDMCP and customize its associated files.

☐ **Character Cell
Services**   If you plan to use terminal windows, make sure your host system is configured
for Telnet or DECnet access.

☐ **Terminal and
Group Settings**   You can use the terminal's configuration manager or your own host-based
resource files to configure and manage terminals. See the *Managing Terminals
and Work Groups* section in this guide.

☐ **Printing**

☐ **Printer Ports**   Your host system can use the TCP/IP transport to access a serial or parallel
printer connected to a VXT 2000 windowing terminal. To set up a printer port,
see Section 2.9.

☐ **Printer Names**   Select `ptys` and corresponding printer names for each VXT. Add a line in the
`/etc/vxtlpdtab` file for each printer.

☐ **VXT Application
launcher**   VXT Version 2.1 software provides an application launcher that lets terminal
users send commands to a host to display host X applications on the terminal.
For setup procedures, see the Application Launcher section in this chapter.

Booting and Downloading

This section describes the VXT system images, how to create directory structures, and how to download the VXT software using the BOOTP/TFTP protocol.

2.2 VXT System Images

VXT Version 2.1 software provides the following system image files:

Table 2–1 VXT System Images

Install this image . . .	If you want . . .
vxt	VXT software with local clients. This image can run on color, gray scale, and monochrome VXT 2000 windowing terminals with 10 megabytes of terminal memory.
vxtex	VXT EX software without local clients. This image can run on color, gray scale and monochrome VXT 2000 windowing terminals with only 4 megabytes of terminal memory.
vxtldr	To support terminals in server-based mode from an InfoServer system on another Ethernet segment.

VXT BOOTP Daemon You need a daemon to load the system images from an HP–UX system. The VXT installation kit provides a BOOTP daemon, if your system does not have one.

2.3 Creating Directory Structures

You must log in as the superuser to perform all procedures in this chapter.

Use the following commands to create the directory structure that will contain the VXT system images for IP loading:

```
#  mkdir /usr/tftpboot              # may already exist
#  ln -s /usr/tftpboot /tftpboot    # may already exist
```

You can use an alternate location for /usr/tftpboot, such as /var/tftpboot.

2.4 Loading VXT Software with IP—Host System Setup

Perform the following steps to boot the VXT 2000 windowing terminal using IP:

**Step 1.
Edit the /etc
/inetd.conf file.**

Find the `bootp` and `tftp` command lines in the `/etc/inetd.conf` file. Your `inetd.conf` may vary depending on your configuration. Modify these command lines to look like the following example.

Example

❶ `bootps dgram udp wait   root   /etc/bootpd   bootpd  [-d1]`
❷ `tftp   dgram udp nowait root   /etc/tftpd    tftpd`

Explanation of Example

Make sure to remove the # comment character from the beginning of the `bootp` and `tftp` lines.

❶ The `bootps` command line causes `/etc/inetd` to start the `bootpd` when the system receives a request for BOOTP services.

- The (-dn) sets the debugging level to n. In this case, the debugging level is set to 1 (`d1`).

Check the syslog Daemon

Verify that the `syslog` daemon is running. The `syslog` file should be stored in `/usr/adm/syslog`. Check the `/etc/syslog.conf` configuration file for the location of the `syslog` file.

To view the most recent log entries, enter the following command and substitute the name of your `syslog` file:

    # **tail /usr/adm/syslog**

❷ The `tftp` command line causes the `/etc/inetd` process to start the `tftp` daemon when the system receives a request for TFTP services.

- On HP–UX systems, `tftpd` requires an entry in the `passwd` database for an account named `tftp`. The password field should be *, the group membership should be guest, and the login should be `/bin/false`. For example:

    # **tftp:*:510:guest:tftp server:/usr/tftpdir:bin/false**

- The `tftpd` daemon performs a `chroot` (change root) command to the home directory of this user. This restricts `tftp` clients to accessing files placed in the home directory. Clients can only read or write to existing files that the user can read or write to.

Step 2.
Edit the /etc/bootptab file.

For each terminal, create an entry in the `/etc/bootptab` file. If the file does not exist, you must create it. Be sure to maintain the format of the example file. Using the existing entries as examples, create an entry for your terminal.

The Internet protocol host name used in the `/etc/bootptab` file must be the same as the official host name used in other files that refer to the terminal's IP address. These other files include the `/etc/hosts` name server database. See your system administration manuals for details.

Example

The following example shows a typical HP–UX `bootptab` file with two entries for VXT 2000 windowing terminals. The first entry is for a terminal named `vxtf`, running VXT software. The second entry is for a terminal named `vxte`, running VXT EX software.

Sample /etc/bootptab Entry

```
# Example /etc/bootptab: database for bootp server (/etc/bootpd).
#@(#) $Header: bootptab,v 1.2 90/12/11 11:18:54 jmc Exp $
#
# Format:
# nodename:tag=value:tag=value: ... :tag=value
#
# first field -- nodename (hostname) of terminal followed by colon
#    (should be full domain name)
#
# Blank lines and lines beginning with '#' are ignored.
# Make sure you include a colon and a backslash to continue a line.
# Don't put any spaces in the tag=value string.
# The ht tag MUST precede the ha tag.
#
# The options listed below are useful for HP X Window terminals.
# They are specified as tag=value and delimited by colons.
# For a list of all possible options, see the bootpd.1m man page.
#
# ba -- broadcast bootp reply for testing with bootpquery
# bf -- bootfile (for tftp download)
# ds -- domain name server IP address
# gw -- gateway IP address
# ha -- hardware address (link level address) (hex)
# hd -- home directory for bootfile (chrooted to tftp home directory)
# hn -- send nodename (boolean flag, no "=value" needed)
# ht -- hardware type (ether) (must precede the ha tag)
# ip -- X terminal IP address
# sm -- network subnet mask
# tc -- template for common defaults (should be the first option listed)
# vm -- vendor magic cookie selector (should be rfc1048)
# T144  remote config file name (file name must be enclosed in "")
#
#-------------------------------------------------------------------
vxtf.dfg.dec.com:\
 bf=vxt:\
 hd=/vxt/images:\
 hn:\
 ht=ether:\
 vm=rfc1048:\
 ha=08002b253c3f:\
 ip=12.122.128.33:\
 sm=255.255.255.0:

vxte.dfg.dec.com:\
 bf=vxtex:\
 hd=/vxt/images:\
 hn:\
 ht=ether:\
 vm=rfc1048:\
 ha=08002b253c3f:\
 ip=12.122.128.33:\
 sm=255.255.255.0:
```

Step 3.
Modify /etc/services
file.

You need to modify two lines to match the following example.

The service name should correspond to the service name in `inetd.conf` file.

Example

Add the following two lines to `/etc/services`, if not already present. Make sure there is not a # comment character at the beginning of the lines.

```
bootps          67/udp                  # Provide bootp service.
tftp            69/udp                  # Provide tftp service.
```

Step 4.
Restart the Internet
daemon.

Restart the Internet daemon to initialize the changes you made to the `/etc/inetd.conf` and `/etc/bootptab` files.

_____ **Note** _____

Users cannot connect to the system or load from the system during the short time required to restart the daemon.

_____

Examples

1. You must supply the process ID (PID) of the daemon in the restart command. To display the PID of the `inetd` daemon, use the following command:

   # **ps –ef | grep inetd**

   Here is a typical system response to the `ps -ef` command:

   ```
       root 16004 15710  2 15:22:09 ttys2    0:00 grep inetd
       root 1087     1  0  Apr 14  ?         0:06 /etc/inetd
   ```

   In the preceding example, 1087 is the PID of the `inetd` process.

2. To restart the `inetd` daemon using this PID, enter the following command:

   # **kill –9 1087; /etc/inetd**

Step 5.
Load the terminal.

After you complete these procedures, you can load the terminal from the newly configured system. Turn on the terminal, then quickly press and release the halt button on the rear of the terminal to display the >>> prompt. At the >>> prompt, enter the following boot command:

>>> **b/10000** `Return`

Fonts

2.5 Font Access

This section describes font paths. The VXT 2000 windowing terminal can access fonts by using the TFTP or NFS transport.

2.5.1 TFTP Font Paths

The TFTP font paths used by the VXT 2000 windowing terminal depend on the system setup of the tftp daemon.

2.5.2 Unrestricted tftp

If you have set the home directory for user tftp in /etc/passwd to /, then you are effectively using tftp in unrestricted mode. The VXT 2000 user must specify the full path to the fonts they plan to access. For example, if you choose the default directory locations for VXT fonts when installing VXT software, you can use the following paths:

```
/tftpboot/vxt/fonts/100dpi/fonts.dir
/tftpboot/vxt/fonts/75dpi/fonts.dir
/tftpboot/vxt/fonts/misc/fonts.dir
```

The previous example assumes a symbolic link from /tftpboot to /usr/tftpboot. If you do not use symbolic links, the paths are

```
/usr/tftpboot/vxt/fonts/100dpi/fonts.dir
/usr/tftpboot/vxt/fonts/75dpi/fonts.dir
/usr/tftpboot/vxt/fonts/misc/fonts.dir
```

2.5.3 Restricted tftp

If you set the home directory for user tftp in /etc/passwd to /usr/tftpboot, you can use the following paths to access the fonts:

```
/vxt/fonts/100dpi/fonts.dir
/vxt/fonts/75dpi/fonts.dir
/vxt/fonts/misc/fonts.dir
```

2.5.4 NFS Font Paths

If you use the NFS transport to access fonts or host-based resource files, the file system containing the fonts and resource files must be exported to allow NFS access. Modify the /etc/exports file to list the file system, access privileges, and clients allowed access. Here are examples of exported file systems:

```
/usr/bin                    # export to the world
/usr    -ro                 # export as read-only to the world
/usr/local  -ro vxtc vxtm   # export as read-only to clients
                            # vxtc and vxtm
```

2.6 PCF Font Format for VXT 2000 Windowing Terminals

The terminal requires fonts in the portable compiled font (PCF) format. VXT software can access fonts in big endian and little endian format. If you have existing PCF fonts, you do not need to recompile to use them with the VXT 2000 windowing terminal.

2.6.1 UNIX Fonts

VXT software relies on the `fonts.dir` file located in each font directory.

mkfontdir

If you make any changes in the directories where the fonts are stored, you must update the `fonts.dir` file using the `mkfontdir` utility.

Use `mkfontdir` to create a new or updated `fonts.dir` file.

Enter the font paths in the Customize Font Path dialog box, accessed from the Terminal Manager window's Customize menu. See *VXT 2000+/VXT 2000 Windowing Terminal User Information* for instructions.

2.7 Compiling Fonts for HP–UX TFTP Systems

This section describes font utilities and how to compile and install custom fonts.

2.7.1 Font Utilities

The VXT software kit for UNIX systems includes font utilities. Use these utilities to compile custom fonts for the terminal. Make sure to include the directory where you installed the utilities in your PATH variable; the default location is `/usr/local/bin`. The default location for the man pages is `/usr/local/man/man1`. See your host system documentation for information about using man pages.

2.7.2 Compiling and Installing Custom Fonts for HP–UX Systems

If you have fonts that are not in the PCF format, you can compile fonts and create the `fonts.dir` file with the font utilities supplied. To compile a font, the source font must be in bitmap distribution format (BDF). BDF is the standard source format for fonts used with the X Window System.

First determine the directory to contain the compiled PCF fonts. You must place all fonts that you want to use in the same directory. Create this directory if it does not exist. This directory must contain PCF fonts only, if the font utilities are to work properly.

To compile the fonts:

1. Use the `cd` command to go to the directory containing the source .bdf fonts.

Fonts

<hr>

Check for Duplicate File Names ───

Make sure the directory does not contain any .pcf files with the same names as the .bdf files your are compiling. Any existing .pcf files with the same names will be overwritten.

<hr>

mkvxtfonts

2. Compile the fonts from BDF to PCF, using the `mkvxtfonts` utility:

```
# mkvxtfonts *.bdf
```

If you do not specify a file, the default is *.bdf.

This example assumes that `mkvxtfonts` was installed in this default directory. If `mkvxtfonts` was not installed in `/usr/local/bin`, specify the complete path to `mkvxtfonts`.

instvxtfonts

3. Move the fonts to the destination directory by using the `instvxtfonts` utility:

<hr>

Check for Duplicate File Names ───

Make sure the destination directory does not already contain .pcf files with the same names as the files you are copying. Any existing files with the same names will be overwritten.

<hr>

```
# instvxtfonts [-c] path-to-pcf-directory *.pcf
```

path-to-pcf-directory is the path to the directory you want the .pcf files to be placed in. You must specify the path. If you do not specify the .pcf files, the default is *.pcf.

This command moves the specified .pcf files from the current directory to the target directory. The command also creates a `fonts.dir` file in the target directory, listing all .pcf fonts (new and existing) in the directory.

The `-c` option lets you copy the `.pcf` files to the destination directory instead of moving them.

This example assumes that `instvxtfonts` was installed in this default directory.

Repeat this procedure for each directory containing BDF fonts you want to use.

2.8 Managing Fonts

VXT Version 2.1 software implements the X Version 11 Release 5 (X11R5) server, so you can access fonts from multiple systems, using different transports. If you serve fonts from multiple systems, refer to the *System Management Overview* chapter for requirements.

2.8.1 Alias Names and XLFD Names

fonts.alias

Most systems have a `fonts.alias` file that allows fonts to have multiple names. VXT Version 1.2 and later supports the `fonts.alias` file mechanism, so an understanding of the file may be useful. Each line in the file lists two names — an alias name, followed by the actual name of the font to use when the alias is requested.

XLFD

Many applications use the X logical font description (XLFD) naming convention for fonts. The MIT X Window System documentation describes this convention. Fonts with the same XLFD name should be interchangeable. They may look slightly different, but there should be no important differences. Here is an example of an XLFD name:

`-adobe-new century schoolbook-bold-r-normal--10-100-75-75-p-66-iso8859-1`

Generally, aliases are short names for XLFD names, such as `fixed`, `8x13`, and `times_bold14`. In most cases, substituting one font with a similar font does not cause problems. Applications that are particular about their fonts (such as WYSIWYG editors) generally use XLFD names.

X Services

HP–UX systems provide XDMCP support through the `vuelogin` utility, which is part of the visual user environment (vue).

The `/etc/vuerc` script file must be invoked at system startup. This script executes the `Vuelogin` file. Refer to the man pages for additional information.

Character Cell Terminal Services

To configure your system for Telnet access, see your host system documentation.

You must log in as the superuser.

Managing Terminal and Group Settings

When a terminal uses a host-based VXT system image, the terminal stores its customizations in a native resource file in the terminal's nonvolatile memory (NVRAM). You have two options for centrally managing terminals on your network:

- Use your terminal's configuration manager to manage the settings in the native resource file of each terminal.

- Create your own resource files on a host system and configure terminals to access the files.

See the *Managing Terminals and Work Groups* section of this guide for details.

Printing

2.9 Setting Up HP–UX Access to VXT 2000 Printer Ports

With VXT Version 2.0 or later software, HP–UX hosts can use the TCP/IP protocol to access a serial or parallel printer connected to a VXT 2000 windowing terminal.

The printer ports are typically used for printers, but you can attach other devices. You can use the serial port to read data from and send data to the attached device. VXT 2000 hardware restricts the parallel port to sending data only.

Software Requirements

You need the VXT printer support utilities subset provided with the VXT software installation kit. This subset provides the `vxtlpd` VXT printer daemon.

`vxtlpd` Printer Daemon

The `vxtlpd` printer daemon works with the UNIX printer daemon and filters to send data to and from the specified terminal printer port. The `lpd` command on the host communicates with the slave side of a pseudoteletype `pty` as it would to any serial device.

The `vxtlpd` printer daemon reads a configuration file that specifies the `ptys`, the terminal's IP address and port number, and the starting timeout period for retrying a connection. The timeout period doubles each time a connection attempt fails, up to a maximum of 30 minutes.

Configuration File Syntax

You must create the configuration file used with the `vxtlpd` printer daemon. The default name and path for the configuration file is `/etc/vxtlpdtab`. You can use `vxtlpd` to specify a different file. Use the following syntax for configuration file entries:

/dev/ptyqf *ip_address_or_name* 9100 time #optional comment

Examples:

/dev/ptyqf 1.2.3.4 9100 60

/dev/ptyqe myvxt 9100 120

- Specify the `pty` device used for printing.
- You can specify the terminal's host name or IP address (in dotted decimal notation).
- VXT 2000 windowing terminals use IP port 9100 for the printer.
- The timeout period specifies the time in seconds between retries if the connection to the terminal fails. The maximum timeout period is 30 minutes.

  If you specify 0 seconds, then no retries are done. These retries are only done if the terminal is not reachable. If the terminal is reachable but the printer is not ready or not available, the printing job will be lost and must be requeued by the user.

Printing

Example: Suppose the starting timeout period is 60 seconds. If a connection is not made after 60 seconds, the timeout period advances to 120 seconds. If a connection is not made after 120 seconds, the timeout period advances to 240 seconds and continues advancing until 30 minutes is reached.

Selecting `ptys`

Choose the `ptys` you want to use.

List the `ptys`. On most systems, you can use the following command to get an alphabetical list:

`ls /dev/pty*`

Start with the last `pty` in the alphabetical list and proceed to earlier ones until a free one is found.

The `vxtlpd` command connects to the master side of the `pty`. The slave side of the `pty` is used by the host's printing system. Put the selected `ptys` and all other required information in the configuration file for `vxtlpd`, then start `vxtlpd`.

Creating Printers

Creating printers for the print subsystem is identical to creating printers directly connected to the system. The procedure differs for each system and each printer type.

In each case, the device for the printer is the slave side of the `pty` for the corresponding VXT 2000 windowing terminal.

For example, the slave device `/dev/ttyqf` corresponds to the master device `/dev/ptyqf`.

If you do not configure the printer correctly, you may get printing errors, displayed errors messages, or no printout. Among possible solutions, Digital recommends that you manually assign protection to `ptys` and verify that they are not being used by other users.

Setting Up a Printer

Use `lpadmin` command to set up the ports on supported HP–UX hosts to access the printer on a VXT 2000 windowing terminal:

lpadmin -p*printer_name* -m*printer_model* -v*device*

- *printer_name* is the name assigned to the printer.
- *printer_model* is the type of printer. The type of printer attached must be correct or the output will be erroneous.
- *device* is the slave side of the pty.
  For example:

  `/dev/ttyqf`

For more information, see the man pages for `lpadmin`, `enable`, and `accept`.

Starting vxtlpd

If you previously installed vxtlpd, kill all the running copies of vxtlpd. Note that this action also stops any jobs currently printing on VXT 2000 windowing terminals.

Before starting a new version of vxtlpd:

1. Enter the following command:

    # **ps –ef | grep vxtlpd | sed '/grep/d'**

2. For each PID, enter the following command:

    # **kill –9 *pid***

To automatically restart vxtlpd each time the system is rebooted, you must edit the /etc/rc file. You can also run vxtlpd from the command line.

To run vxtlpd from the command line, use the following syntax:

vxtlpd [-c *file*] [-l *file*] &

*   The –c *file* option lets you specify the configuration file. The default file is /etc/vxtlpdtab.

*   The –l *file* option lets you specify a log file for error messages and other messages. If you omit this option, no messages are generated.

*   Comments begin with the # character and can continue to the end of the line.

To automatically start vxtlpd when the system is rebooted, add the following lines to /etc/rc.local:

```
[ -x /usr/localbin/vxtlpd ] && {
 /usr/local/bin/vxtlpd [-c config_file ] [-l log_file] > /dev/console
}
```

Use the correct path to vxtlpd if you installed it in a different location. Specify the –c and –l options if desired.

Customizing the Terminal's Printer Port Settings

You must customize the printer port settings on the terminal to match the port and printer in use. For more information, see *VXT 2000+ /VXT 2000 Windowing Terminal User Information*.

2.9.1 Printing from the HP–UX Host

To submit a printing job from the HP–UX host to the terminal's printer, use the lp command.

Syntax

Enter lp commands as follows:

lp -d*vxt_printer printfile*

*   *vxt_printer* is the name of the printer connected to the terminal. Use the name that was assigned when setting up the printer with the lpadmin command.

*   *printfile* is the file to print.

Application Launcher

Overview

VXT Version 2.1 software provides an application launcher that lets users enter commands from a host session to display remote X applications on the terminal.

The host passes remote launching commands to the terminal's local window manager. Users can enter the commands through the VXT Terminal Manager window. Advanced users can use the local window manager to bind commands to mouse buttons, keyboard keys, or terminal menus; this method allows users to start remote X applications without running the terminal manager or a remote session manager.

Installation

The application launcher is part of the VXT software kit. See Chapter 1 for installation instructions.

The host system must have a C compiler and X Window System link libraries to build the application launcher.

Security

Users must be authorized to access the terminal from the host system. You can enter authorized hosts and users in the Customize Security dialog box of the Terminal Manger window. You can centrally manage these security settings by using the terminal's configuration manager or a host-based resource file. See the *Managing Terminals and Work Groups* section.

Setup and Use

The VXT installation procedure automatically builds the executable application launcher file named `vxtlaunch`. By default, the file is placed in the `/usr/local/bin` directory. Notify users of the launcher's name and location.

To launch an application, a terminal user must

1. Log in to the host.

2. Run the application launcher.

3. Enter a command to launch the desired remote application.

See *VXT 2000+/VXT 2000 Windowing Terminal User Information* for details on running the application launcher and entering commands.

Running the Application Launcher

After logging in to the host, the user must start the application launcher. There are several methods to start the launcher:

- Interactively

- In the user's .login file

- In the .xsession file

If a user starts the launcher from a login file, the launcher will run each time the user logs in and consume process space.

**Entering Remote
Launching
Commands**

Users can enter launch commands from the Terminal Manager window (Create dialog box). Advanced users can use the local window manager to bind commands to buttons, keys, or menus (Workspace: Customize Resource Configuration dialog box).
